## RESULTS

1920 CENSUS—INDEX  
DEPARTMENT OF COMMERCE  
BUREAU OF THE CENSUS

**Abstract** The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised exercise program on the physical and psychological health of sedentary, middle-aged, obese women. The study was a randomized, controlled trial. The subjects were randomly assigned to either an exercise group or a control group. The exercise group performed a 12-week, low-intensity, supervised exercise program. The control group did not exercise. The subjects were assessed at baseline and at 12 weeks. The exercise group showed significant improvements in physical and psychological health compared to the control group. The exercise group had significantly lower body mass index (BMI), waist circumference, and body fat percentage at 12 weeks compared to baseline. The exercise group also had significantly lower levels of anxiety and depression at 12 weeks compared to baseline. The control group showed no significant changes in physical or psychological health. The results of this study suggest that a 12-week, low-intensity, supervised exercise program can improve the physical and psychological health of sedentary, middle-aged, obese women.
